Excess returns and competitive rankings presented are based on composites, calculated as an asset-weighted average return of similarly-managed individual portfolios. Excess return is calculated as the difference between the performance returns of the investment strategy composite and the respective benchmark return over the measurement period presented, and is annualized for periods greater than 1 year. Information Ratio is defined as the Excess Return divided by Tracking Error over the measurement period presented. Returns are presented before the deduction of management fees and will be reduced by advisory fees incurred in the management of the portfolio. For a description of advisory fees, please see Form ADV, Part II. For additional performance information, please refer to the fully-compliant presentation, which must accompany or precede this material.

Principal Risks

The principal risks are generally those attributable to bond investing. Holdings are subject to market, issuer, credit, prepayment, extension and other risks, and their values may fluctuate. Market risk is the risk that securities may decline in value due to factors affecting the securities markets or particular industries. Issuer risk is the risk that the value of a security may decline for reasons specific to the issuer, such as changes in its financial condition. The strategy may invest in mortgage-related securities, which can be paid off early if the borrowers on the underlying mortgages pay off their mortgages sooner than scheduled. If interest rates are falling, the strategy will be forced to reinvest this money at lower yields. Conversely, if interest rates are rising, the expected principal payments will slow, thereby locking in the coupon rate at below market levels and extending the security's life and duration while reducing its market value. High yield bonds carry particular market risks and may experience greater volatility in market value than investment grade bonds.

Foreign investments could be riskier than U.S. investments because of exchange rate, political, economic, liquidity and regulatory risks. Additionally, investments in emerging market countries are riskier than other foreign investments because the political and economic systems in emerging market countries are less stable.

Various strategies mentioned in this document employ a quantitative investment process. The process is based on a collection of proprietary computer programs, or models, that calculate expected return rankings based on variables such as earnings growth prospects, valuation, and relative strength.

Data imprecision, software or other technology malfunctions, programming inaccuracies and similar circumstances may impair the performance of these systems, which may negatively affect performance. Furthermore, there can be no assurance that the quantitative models used in managing the strategy will perform as anticipated or enable the strategy to achieve its objective.

The Composite performance information represents the investment results of a group of fully discretionary accounts managed with the investment objective of outperforming the benchmark.

Information is subject to change at any time. Gross returns are presented after all transaction costs, but before management fees. Returns include the reinvestment of income. Net performance is shown after the deduction of a model management fee equal to the highest fee charged.
